

NovaSure Procedure

The NovaSure procedure is a quick, safe, simple, one-time endometrial ablation treatment. This minimally invasive procedure controls heavy bleeding by using energy to remove the lining of the uterus. The average treatment time is about 90 seconds, and only needs to be performed once to lighten or stop your periods. No pretreatment drugs are required and NovaSure can be performed in the hospital or in your doctor's office.

Without the side effects of hormones or the risks of hysterectomy, *NovaSure has a quick recovery time* so you can get back to your life sooner. Most women experience no pain after the procedure, and can return to work and regular activities the next day.

NovaSure reduces bleeding and much more

With more than 500,000 patients treated to date, NovaSure is proven safe and successful. A clinical trial has shown that more than 9 out of 10 women return to normal or lower than normal bleeding levels following treatments with NovaSure. For some women, their periods even stopped completely.

Many women also experienced a reduction in PMS and painful periods, as well as other benefits such as less anxiety, greater self-confidence, and a boost in energy. NovaSure clinical trial post treatment survey results reveal,

45% reduction in women reporting PMS

64% reduction in women reporting pain

68% reduction in women reporting anxiety

71% reduction in women reporting a lack of self-confidence

Nearly 4 fold reduction in women reporting a lack of energy
